STUDENT PLACEMENT DETAILS MANAGEMENT SYSTEM

An Industry-Oriented Mini Project Report

Submitted to

Jawaharlal Nehru Technological University, Hyderabad

in Partial Fulfilment of the requirements for the Award of the Degree of

BACHELOR OF TECHNOLOGY
IN
INFORMATION TECHNOLOGY

By

C.MAHESH	**22E11A1206**
K. SRAVAN	**22E11A1222**
M.NITHISH KUMAR	**22E11A1231**
A. RUTHWIK REDDY	**22E11A1242**
S. KIRAN	**22E11A1243**
SK. ABDUL HAMEED	**22E11A1247**

Under the Guidance of

Mr P. MUNISEKHAR
Associate Professor
Department of Computer Science and Engineering

Department of Information Technology
BHARAT INSTITUTE OF ENGINEERING AND TECHNOLOGY
(An Autonomous Institution)

Accredited by NAAC "A" Grade, Accredited by NBA (UG Programmes: CSE, ECE),
Approved by AICTE, Affiliated to JNTUH Hyderabad
Ibrahimpatnam-501 510, Hyderabad, Telangana

JUNE 2025

Department of Information Technology

BHARAT INSTITUTE OF ENGINEERING AND TECHNOLOGY

(An Autonomous Institution)

Accredited by NAAC "A" Grade, Accredited by NBA (UG Programmes: CSE, ECE),
Approved by AICTE, Affiliated to JNTUH Hyderabad
Ibrahimpatnam-501 510, Hyderabad, Telangana

CERTIFICATE

This is to certify that the Industry Oriented Mini project work entitled ***"STUDENT PLACEMENT DETAILS MANAGEMENT SYSTEM"*** is a beneficial project work carried out by

C.MAHESH	**22E11A1206**
K. SRAVAN	**22E11A1222**
M.NITHISH KUMAR	**22E11A1231**
A. RUTHWIK REDDY	**22E11A1242**
S. KIRAN	**22E11A1243**
SK. ABDUL HAMEED	**22E11A1247**

In the Department of Information Technology at **Bharat Institute of Engineering and Technology,** Hyderabad, is submitted to **Jawaharlal Nehru Technological University**, **Hyderabad,** in partial fullfillment of the requirements for the award of the degree of **Bachelor of Technology** degree in **Information Technology** during 2024-25.

Guide:

Mr. P. Munisekhar
Associate Professor
Department of Computer Science and Engineering,
Bharat Institute of Engineering and Technology,
Ibrahimpatnam-501 510, Hyderabad, Telangana

Department I/C:

Ms. Y. Sailaja
Assistant Professor
Department of Information Technology,
Bharat Institute of Engineering and Technology,
Ibrahimpatnam-501 510, Hyderabad, Telangana

Viva Voce held on_____

Internal Examiner

External Examiner

ACKNOWLEDGEMENT

The satisfaction that accompanies the successful completion of the task would be incomplete without mentioning the people who made it possible, whose constant guidance and encouragement crowned all the efforts with success.

We avail this opportunity to express our deep sense of gratitude and hearty thanks to **Sri CH. Venugopal Reddy**, Chairman of BIET, for providing a congenial atmosphere and encouragement.

We want to thank **Prof. G. Kumaraswamy Rao**, Former Director & O.S. of DLRL Ministry of Defence, Sr. Director R&D, BIET, and **Dr. V Srinivasa Rao**, Dean CSE, for having provided all the facilities and support.

We would like to thank our Department Incharge, **MS. Y. Sailaja**, for encouragement at various levels of our Project.

We are gratetful to our Project Coordinator, **Ms. A. Soniya**, Assistant Professor of Electronics Communication and Engineering, for her support and cooperation throughout the project process.

We are thankful to our guide, **Mr. P. Munisekhar**, Associate Professor of Computer science Engineering his sustained, inspiring Guidance and cooperation throughout the process of this project. His wise counsel and suggestions were invaluable.

We express our deep sense of gratitude and thanks to all the Teaching and Non-Teaching Staff of our college who stood with us during the project and helped us to make it a successful venture.

We place the highest regard on our parents, our Friends and Well-wishers who helped a lot making the report of this project.

C.MAHESH	**22E11A1206**
K. SRAVAN	**22E11A1222**
M.NITHISH KUMAR	**22E11A1231**
A. RUTHWIK REDDY	**22E11A1242**
S. KIRAN	**22E11A1243**
SK. ABDUL HAMEED	**22E11A1247**

DECLARATION

We hereby declare that this Industry Oriented Mini Project is titled "***STUDENT PLACEMENT DETAILS MANAGEMENT SYSTEM"*** is a genuine work carried out by us in the **Bachelor of Technology (Information Technology)** degree course of **Jawaharlal Nehru Technological University**, **Hyderabad** and has not been submitted to any other course or university for the award of the degree by us.

Signatures of the Project Team Members:

1.

2.

3.

4.

6.

ABSTRACT

Placement department files the student's details (such as roll no, name, department, course, aggregate etc.) along with the company details (if selected) who attended the different placement drives (on/off campus). This mini project focuses on analyzing the placement data of [Institution/Organization Name] to assess the efficiency, trends, and outcomes of the placement process. The main objective of the project is to collect and organize placement related information such as the number of companies involved, company details (if selected) student profile, who attended the placement drive etc. Our project provides the facility of maintaining the details of the students. It reduces the manual work and consumes less paper work to reduce the time. This project is developed with PHP/HTML MySQL for the database.

Keywords: Placement Management System, Web Technologies, Database Management, Automation, Data Analytics.

1. INTRODUCTION

In the current era of technology-driven education and competitive job markets, student placement has become an essential aspect of every academic institution. Placement not only signifies the transition of students from academic life to professional careers but also serves as a critical benchmark of an institution's performance and reputation. Managing placement activities efficiently involves maintaining records of student information, company details, eligibility criteria, placement results, and interview schedules. When handled manually or through fragmented systems, these tasks can become cumbersome, time-consuming, and prone to errors.

This project, titled "Students Placement Details Using HTML and SQL," is developed to streamline and digitize the placement process. It aims to provide an organized and dynamic system where all placement-related information can be stored, accessed, and updated with ease. The use of HTML allows for the creation of a clear and structured user interface that can be accessed through a standard web browser, making the system user-friendly and widely compatible. At the same time, SQL is used as the database language to handle the back-end operations, such as storing student profiles, company requirements, and placement statuses in a secure and efficient manner.

The system is designed to serve multiple stakeholders, including students, placement officers, and institutional administrators. Students can view available placement opportunities and check their eligibility, while administrators can add, update, or delete records as needed. The integration of HTML and SQL provides a lightweight yet powerful solution that can handle real-time data interactions without the need for heavy software infrastructure.

This project not only fulfills an immediate institutional need but also gives students hands-on experience in web development and database management. Through the development of this system, it becomes evident how basic technologies can be effectively combined to create meaningful, realworld applications that enhance the educational ecosystem and prepare students for their future careers.

2. Motivation

The motivation behind developing the Student Placement Details Management System stems from the growing need for efficiency, accuracy, and transparency in managing placement-related data within educational institutions. In many colleges and universities, placement activities are still handled manually using spreadsheets, physical records, or unstructured digital documents. This traditional approach is time-consuming, error-prone, and lacks the ability to scale with increasing student numbers and company participation. These limitations often lead to miscommunication, data loss, and difficulties in tracking placement progress.

In an era where digital transformation is reshaping every aspect of education and administration, it becomes essential to develop a system that can streamline and automate placement processes. By using HTML to build a simple, user-friendly web interface and SQL to manage and retrieve structured data efficiently, this project aims to bridge the gap between manual efforts and digital solutions. The system allows students to input their details, view eligibility status, and stay updated on placement drives, while placement officers can manage records, schedule interviews, and generate reports—all from a centralized platform.

The motivation is not only technical but also practical. A web-based solution reduces administrative workload, improves data accuracy, and ensures timely communication between students and the placement cell. Furthermore, building such a system using basic, open-source technologies provides an excellent learning opportunity for students to understand real-world application development and database integration. Overall, this project is motivated by the desire to create a low-cost, efficient, and scalable placement management tool that benefits both students and institutions.

3.Problem Statement

In modern educational institutions, the placement process plays a vital role in bridging the gap between academic learning and professional employment. As colleges and universities grow in size and reputation, so does the complexity of managing placement-related activities. One of the key challenges faced by placement cells is the efficient organization and tracking of student records, company data, eligibility criteria, interview schedules, and placement outcomes. In many institutions, this information is still handled through manual processes or semi-digital tools like spreadsheets, which are not only time-consuming but also prone to human error, duplication, and mismanagement.Students often struggle to stay updated on which companies are visiting the campus, their eligibility status, and the timeline of placement events. Similarly, placement officers find it difficult to maintain up-to-date information on each student's placement status and to communicate effectively with companies and students alike. The lack of a centralized system results in confusion, miscommunication, and delays that can negatively impact the placement success rate of the institution.

To address this issue, there is a clear need for a web-based system that can store, manage, and display placement details in an organized and user-friendly manner. The proposed solution involves using HTML for the front-end development to create a clean and accessible interface, while SQL is used at the back-end for storing and retrieving placement-related data efficiently. This combination offers a lightweight yet powerful solution that enables both students and administrators to interact with placement data in real time, enhancing the overall coordination and success of the placement process.

By implementing a system built on HTML and SQL, educational institutions can reduce administrative workload, improve data accuracy, and ensure that students are better informed and prepared for job opportunities. The system aims to centralize all placement data, making it easily accessible and manageable, thus transforming the traditional placement process into a streamlined and efficient digital workflow.

4.objectives

The objective of the Student Placement Details Management System is to create an efficient, accessible, and reliable web-based platform that simplifies the process of managing student placement data in educational institutions. This system aims to eliminate the traditional manual methods of record-keeping, which are often tedious, error-prone, and difficult to update. With the use of HTML for the front-end and SQL for backend data operations, the project seeks to provide a lightweight yet functional solution that is easy to deploy and maintain.

Feasibility Report: The feasibility study evaluates whether the project is practical and achievable in terms of cost, usability, and technical implementation. It ensures that the proposed system can be developed and deployed effectively in a real-world educational setting. This report focuses on three key areas: economic feasibility, operational feasibility, and technical feasibility.

4.1 Economic Feasibility:

Economic feasibility evaluates whether the project is financially viable and cost effective. For the Placement Details Management System, the use of open-source technologies significantly reduces development and deployment costs

Development Costs:

The primary costs involve the human resources required for designing, developing, and testing the system. Since HTML, PHP, and MySQL are standard technologies, developers with the necessary skills are readily available, and their training requirements are minimal if standard web development practices are followed.

Software Costs:

HTML, PHP, MySQL, and web servers like Apache are open source and free to use, eliminating significant software licensing costs. The operating system for the server can also be a cost-effective Linux distribution. Client access is via standard web browsers, which are also free.

Hardware Costs:

The system requires a server to host the application and database. A standard server machine with sufficient processing power, RAM, and storage can be utilized. This could be a dedicated department. The hardware requirements are modest and can likely be met with existing infrastructure or minimal investment compared to proprietary systems.

Maintenance Costs:

Ongoing costs involve server maintenance, potential software updates for the server environment (OS, PHP, MySQL, Apache), and bug fixes or minor enhancements. These are typically manageable with internal IT resources or standard support agreements.

4.2 Operational Feasibility:

Operational feasibility assesses whether the proposed system can be successfully integrated into the existing operational environment and whether it will be used effectively by the target users. The target users are the placement department administrators and staff.

User Acceptance:

The system is designed to automate tedious manual tasks and provide quicker access to information, directly addressing pain points of the current system. A user-friendly and intuitive web interface will be developed to minimize the learning curve for the staff. Training will be provided to ensure they are comfortable using the new system.

Integration into Workflow:

The system will manage the core data and processes related to student and company placement. It will replace manual data entry, filing, and retrieval, directly fitting into and streamlining the existing workflow. The web-based nature allows access from the department's existing computers.

Impact on Organization:

The primary impact is a positive one, freeing up staff time from mundane tasks for more value-added activities. The system is contained within the placement department's operations and does not require significant changes to the broader institutional structure or processes outside the department itself.

Resource Availability:

The necessary human resources (placement staff) and technical resources (computers, network) are already in place. Basic training and technical support will be required, which is operationally feasible.

4.3 Technical Feasibility

Technical feasibility assesses whether the proposed system can be developed and implemented using existing or readily available technology. The proposed system utilizes standard, widely supported, and mature web development technologies: HTML for the front-end structure, PHP for server-side scripting and logic, and MySQL for the database management.

HTML (HyperText Markup Language):

HTML is a fundamental web technology used for creating the structure of web pages. It is welldocumented, easy to learn, and universally supported by all web browsers. Creating input forms, displaying data tables, and structuring the layout of the web interface using HTML is technically straightforward.

PHP (Hypertext Preprocessor):

PHP is a server-side scripting language particularly suited for web development. It has extensive libraries for database interaction (especially with MySQL) and is designed to generate dynamic web content. PHP is open-source, widely used, has a large community, and runs on various web servers (like Apache). Implementing the system's logic for data processing, database operations (CRUD), user authentication, and report generation using PHP is well within the technical capabilities of standard web development.

Web Server (e.g., Apache):

A standard web server, such as Apache, is required to host the PHP scripts and HTML files. Apache is open-source, stable, and widely used for hosting PHP applications. Configuring Apache to serve the application and interact with PHP and MySQL is a common administrative task.

Development Environment: Standard development environments (like XAMPP, WAMP, or MAMP) that bundle Apache, PHP, and MySQL are freely available and easy to set up.providing a suitable platform for development and testing.

5. LITERATURE SURVEY

Student placement management systems are crucial for tracking student progress, placement status, and employer interactions. Manual systems are inefficient, leading to errors, data loss, and poor accessibility. Web-based systems using HTML for front-end and SQL for database management offer a cost-effective, user-friendly, and scalable solution.

5.1 Existing systems

The current system employed by the placement department for managing student and company placement details is primarily manual and paper-based, supplemented by fragmented electronic records, often stored in spreadsheets or word documents. This traditional approach involves a series of manual steps for collecting, storing, processing, and retrieving information.

Student details, including academic performance (aggregate marks), personal information (name, roll number, department, course), and contact details, are typically collected through physical forms or basic digital questionnaires. These forms are then manually transcribed or entered into spreadsheets or physical files. Similarly, information regarding companies, such as their profiles, recruitment criteria, technologies used, and contact persons, is gathered through company brochures, emails, or registration forms submitted during placement drives. This information is also often stored in a noncentralized manner, across various files or local computer drives belonging to different staff members.

The process of scheduling and recording placement drives, whether on-campus or off campus, involves manual coordination, preparation of attendance sheets, and tracking student participation. Updating a student's selection status after a drive requires manually cross-referencing attendance lists, selection lists provided by companies, and individual student records. This multi-step manual process is prone to delays and errors.

Data retrieval for specific queries, such as finding a student's placement status, identifying eligible students for a particular company based on criteria (like aggregate percentage or department), or listing all companies that visited in a given period, involves sifting through numerous files or manually filtering large spreadsheets. Generating reports, such as department-wise placement statistics or a list of students placed in specific companies, is a LABOR - intensive process that requires manual aggregation and calculation of data.

5.2 Limitations of Existing Work

The manual and semi-manual nature of the existing system presents significant drawbacks that hinder the efficiency, accuracy, and effectiveness of the placement department's operations. These disadvantages include:

- **Time-Consuming Data Entry and Management:** Manually entering and updating vast volumes of student and company data is a tedious and time intensive task. This consumes a significant portion of the placement staff's time, which could be better utilized for strategic activities like industry interaction, student counsiling and organizing drives. The sheer volume of data for a large institution exacerbates this issue.
- **Difficulty in Data Retrieval and Accessibility:** Accessing specific information quickly is challenging. Locating a student's complete history, tracking interactions with a particular company, or finding records from past years involves searching through physical archives or disparate digital files, leading to delays and frustration. Data is not centrally accessible to authorized users in realtime.
- **High Chances of Errors and Data Inconsistency:** Manual data entry is susceptible to human errors, such as typos, incorrect data formatting, or entering data into the wrong fields. When the same data exists in multiple places (e.g., a student's aggregate in both a physical file and a spreadsheet), keeping all versions consistent is difficult, leading to data discrepancies and unreliability. Incorrect data can lead to students being overlooked for opportunities or inaccurate reporting.
- **Lack of Centralized Access and Control:** Data is often scattered across different computers or physical locations within the department. There is no single, centralized repository with version control and access permissions, making it difficult to ensure data integrity, track changes, or manage access for different staff members.
- **Inability to Generate Quick Reports and Analyse Trends:** Generating comprehensive reports, such as placement rates by department, average salary packages, or trend analysis over several years, requires significant manual effort to consolidate data. The lack of integrated analytical tools makes it nearly impossible to quickly gain insights into placement performance, identify areas for improvement, or make data-driven decisions.

- **Excessive Paperwork and Storage Issues:** The reliance on paper forms and files generates a large volume of physical documents that require significant storage space and organization. Managing and archiving these documents is cumbersome and costly.
- **Limited Data Security and Privacy:** Physical files are vulnerable to damage (fire, water) or unauthorized physical access. Electronic data stored in simple, unprotected files can be easily lost, deleted, or accessed by unauthorized individuals, posing significant security and privacy risks for sensitive student and company information.
- **Poor Collaboration:** When data is decentralized and manually managed, collaboration among placement staff is hindered. Sharing up-to-date information and coordinating tasks become difficult.

5.3. Proposed System

The proposed Placement Details Management System is designed as a web-based application specifically tailored to address the deficiencies of the existing manual system. Leveraging modern web technologies (HTML, PHP) and a robust relational database (MySQL), the system aims to centralize, automate, and streamline the entire placement data management process. The core of the proposed system is a centralized MySQL database that will store all student academic and personal details, comprehensive company profiles, records of placement drives (both on-campus and offcampus), student attendance information for drives, and the outcomes of recruitment processes, including student selection statuses and offer details. This structured database will ensure data integrity, consistency, and eliminate redundancy.

The system will provide a user-friendly web interface, developed using HTML for structuring content and PHP for handling dynamic interactions and business logic. Placement department administrators and authorized staff will access the system via a web browser, allowing for flexible access from various locations within the institution's network (subject to deployment configuration). Key functionalities of the proposed system will include modules for efficient data entry, modification, retrieval, and deletion of student and company records. The system will facilitate the scheduling and tracking of placement drives, recording student attendance electronically, and updating student selection statuses post-drive. Importantly, the system will include robust search and filtering capabilities, allowing

staff to quickly locate specific records or lists based on various criteria (e.g., department, aggregate, company name, placement status).

By automating manual processes, providing centralized and secure data storage, and enabling efficient data retrieval and reporting, the proposed system will significantly enhance the efficiency, accuracy, and transparency of the placement department's operations. It aligns with the key objectives of reducing paperwork, saving time, minimizing errors, and providing a secure platform for managing campus placement activities.

5.4. Advantages of Proposed System

The proposed Placement Details Management System offers several advantages over the existing manual system, improving efficiency, accuracy, and overall management of placement-related activities. Here are the key benefits:

- **Centralized and Secure Data Storage:**

  All student, company, and placement drive details are stored in a structured MySQL database, eliminating data redundancy.

- **Automation of Manual Processes:**

  Reduces paperwork by digitizing student records, attendance, and selection statuses

  .Automates report generation (placed/unplaced students, company-wise reports, department-wise summaries). Eliminates manual errors in data entry and calculations.

- **Efficient Data Management & Retrieval:**

  Quick search and filtering of records based on criteria like department, CGPA, company name, etc. Real-time updates on placement drive statuses and student selections. .Accessible via web browsers from anywhere (on-campus or remotely, if configured). No need for specialized software— works on standard devices. Role-based access ensures only authorized personnel can edit sensitive data. Students can get quick updates on placement drives and results. Companies can have a streamlined interaction with the placement cell. Better tracking of student attendance and participation in drives.

6. Design Methodology

Students Placement Details project is centered around developing a web-based system that efficiently manages and displays placement-related information for students. This system is designed using HTML for the front-end interface and SQL for the back-end database operations. The process of developing this system follows a structured, modular approach to ensure that both the presentation layer and data management functionalities are cohesive, scalable, and user-friendly.

6.1 System Architecture

The Placement Details Management System is designed based on a standard 3-tier architecture. This architectural pattern separates the application into three logical and physical computing tiers: the Presentation Tier, the Application Tier, and the Data Tier.

This separation of concerns enhances modularity, scalability, and maintainability. The three tiers interact sequentially, with each tier communicating only with the tiers immediately above and below it. This structure ensures a clear flow of data and control within the system.

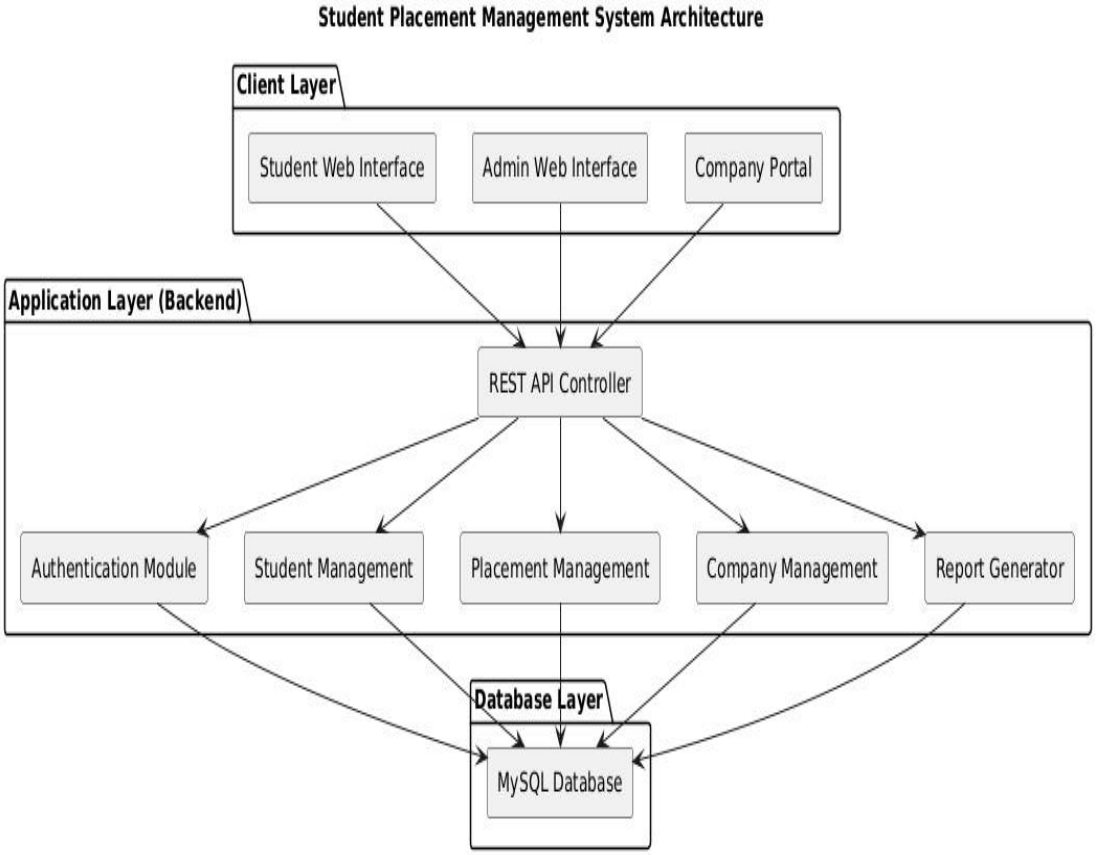

Figure 6.1: Architecture Diagram

6.1.1 Presentation Layer (Client Layer):

This is the front-end interface through which different users interact with the system.

Components:

Student Web Interface:

View placement drives

Apply for jobs

Update personal and academic details

Admin Web Interface:

Manage users and placement drives

View reports and analytics

Perform CRUD operations on students ,companies , and drives

Company Portal: Post job opportunities
Review student applications

Schedule interviews

6.1.2 Application Layer (Backend):

Handles the core business logic and communication between the front end and database.

REST API Controller:

Accepts HTTP requests from the Client Layer

Routes them to the appropriate modules

Returns responses to the client

Authentication Module:

User login and registration

Session handling and role-based access

Student Management:

Student profile creation, update, and deletion

Academic and placement eligibility data

Placement Management:

Creating and managing placement drives

Handling student participation and results

Company Management:

Company profiles

Job postings and eligibility criteria

6.1.3 Database Layer:

The Database Layer of the Student Placement Details Management System plays a fundamental role in storing and managing all the essential data required for the smooth operation of the system. Built using a relational database system like MySQL, this layer serves as the backbone that supports data-driven functionalities across the application. It interacts with the application logic layer to perform all operations related to data retrieval, insertion, updating, and deletion while ensuring the security, integrity, and consistency of stored information.

Student Records:

The database stores detailed information about each student registered in the placement system. These student records typically include fields such as the student's name, roll number or registration number, department, year of graduation, academic performance indicators such as CGPA or percentage, number of backlogs if any, and contact information including email and phone number.

This data is crucial for verifying student eligibility for various placement opportunities based on company requirements. Additionally, the placement status of students—whether placed or unplaced—is maintained, which helps the placement cell track and report the overall placement performance.

Company Details:

Information regarding companies visiting the campus for placements is also stored and managed within the database layer. For each company, the system maintains details such as company name, industry domain, job roles offered, salary packages, eligibility criteria (such as minimum CGPA or allowed backlogs), and contact details of the HR or recruitment coordinator. This data allows students to view and apply for suitable opportunities, and it assists placement coordinators in planning and organizing company-specific drives efficiently. The stored information also facilitates the generation of historical reports and statistics for analysis of company participation over the years.

Placement Drive Data:

The system keeps track of all placement drives conducted within the institution. Each placement drive is linked with a specific company and includes relevant details such as the date and time of the drive, venue, number of application rounds (like written test, group discussion, and interviews), and the number of students shortlisted and selected. This data helps in scheduling and coordination, ensuring that both students and administrators are well informed about upcoming drives. Historical records of placement drives also support data analytics, helping stakeholders understand trends and improve future placement strategies.

Authentication and Role Data:

To ensure security and controlled access, the system implements a robust authentication mechanism supported by role-based access control. User credentials, such as usernames and passwords, are securely stored and used to authenticate users during login. Each user in the system is assigned a specific role—primarily as Admin, Placement Officer, or Student. The Admin has full control over the system, including user management and configuration settings. Placement Officers can manage student data, schedule placement drives, and generate reports, while students have limited access, enabling them to view their profiles, apply for jobs, and check their placement status.

6.2 Data Flow Diagrams

Data Flow Diagrams (DFDs) are graphical representations of the flow of data through an information system. They illustrate how data enters and leaves the system, what processes change the data, and where data is stored. DFDs help visualize the system's boundaries and its interaction with external entities, as well as the flow of information within the system's processes.

The Context-Level DFD provides the highest-level view of the system. It depicts the system as a single process and shows its interaction with external entities. Visual Representation: The diagram contains one central process bubble labeled "Placement Details Management System". Around this central process are external entities, represented as rectangles. The external entities interacting with the system are:

Placement Officer/Administrator: The primary user role managing the system.

Student: Provides personal and academic details.

Company: Provides requirements for drives and selection results.

Arrows indicate the data flows between the external entities and the central system process. These data flows represent information entering or leaving the system:

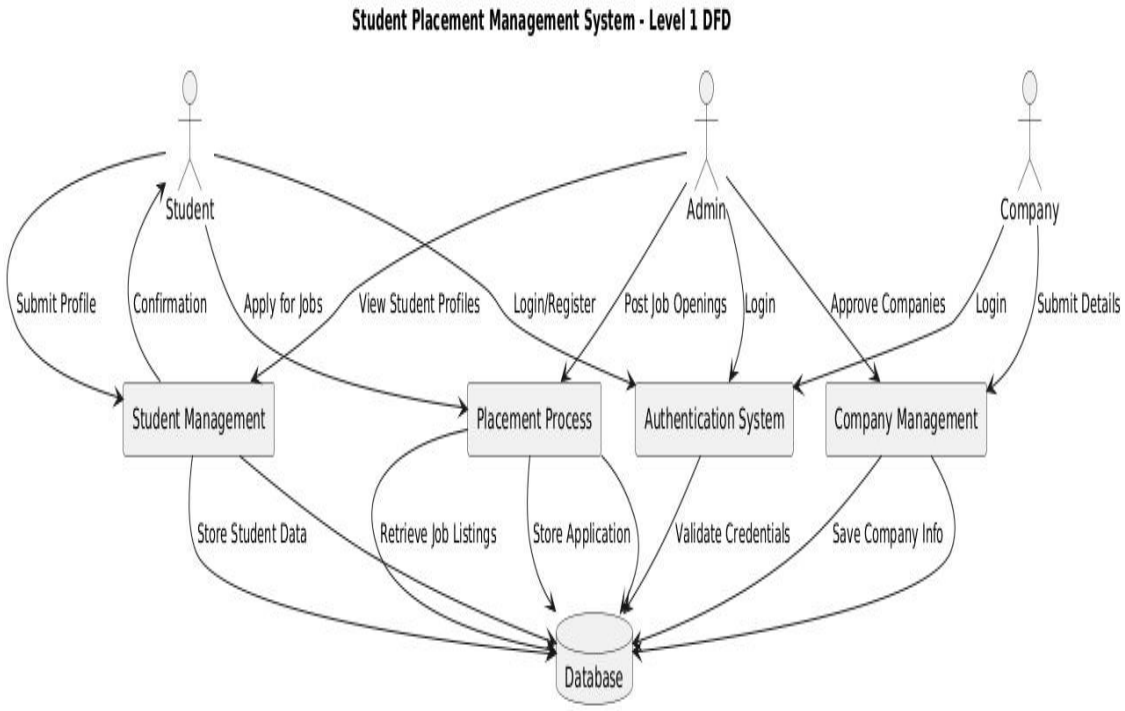

Figure 6.2: Data Flow Diagram

From Placement Officer/Administrator to System:

Student Details (for adding/updating students)

Company Details (for adding/updating companies)

Placement Drive Details (for scheduling drives)

Attendance Records (for recording drive attendees)

Selection Status Updates (for recording placement outcomes)

Report Requests (for generating reports)

System Commands (e.g., login, search criteria)

From System to Placement Officer/Administrator:

System Status/Confirmation

Requested Data (e.g., student list, company list, drive details)

Generated Reports

Error Messages

From Student to System:

Initial Student Information (potentially collected externally and entered by Officer, or conceptually originating from Student)

From System to Student:

(Out of scope for direct interaction as per Chapter 1, so no flows directly to Student in this system) **From Company to System:**
Company Information/Requirements (conceptually originating from Company, entered by Officer) Selection Lists/Results (conceptually originating from Company, entered by Officer) **From System to Company:**
(Out of scope for direct interaction as per Chapter 1, so no flows directly to Company in this system)

6.3 Entity-Relationship Diagram

The Entity-Relationship Diagram (E-R Diagram) is a high-level conceptual data model. It represents the structure of the database by graphically illustrating the entities within the system, their attributes, and the relationships between them. The E-R diagram for the Placement Details Management System models the core data required as identified in the requirements.

Visual Representation: The diagram consists of rectangles representing entities, ovals representing attributes, and diamonds representing relationships. Lines connect attributes to entities and entities to relationships. Cardinality ratios (e.g., 1:1, 1:N, N:M) and participation constraints (optional/mandatory) are shown on the lines connecting entities to relationships.

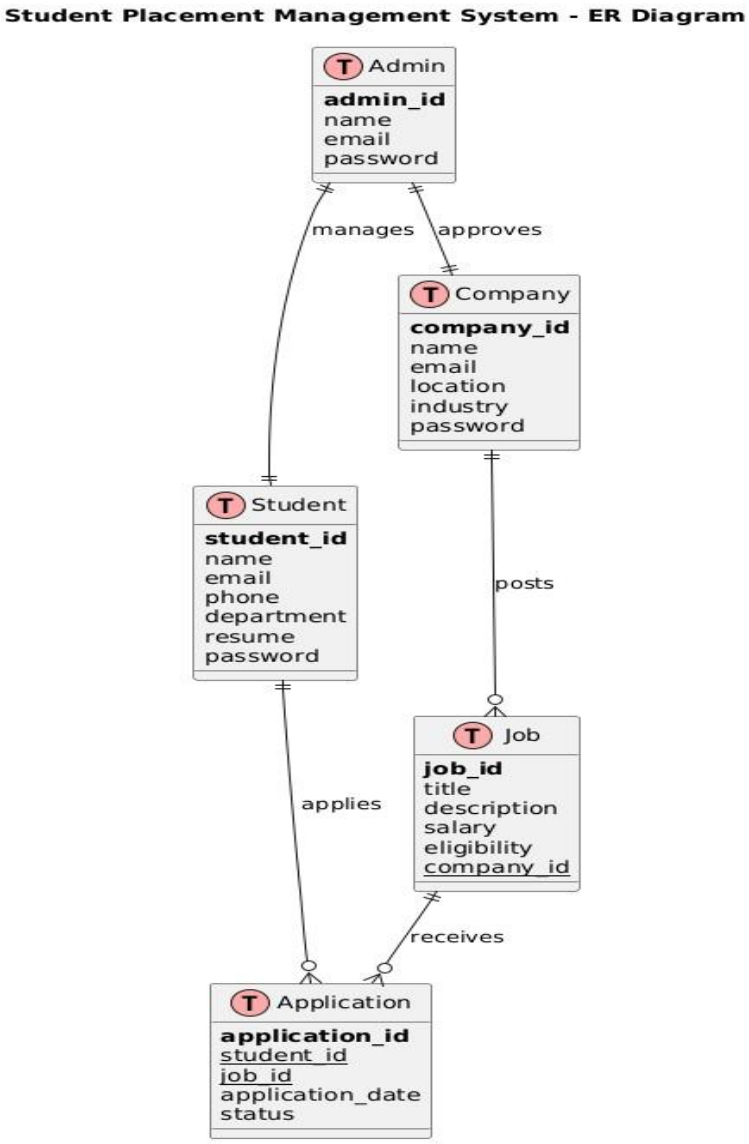

Figure 6.3 : E-R Diagram

Student:

The Student entity represents individuals enrolled in the institution who are eligible to participate in placement drives. Each student is uniquely identified by their Roll Number, which serves as the primary key. Key attributes include the student's Name, Department, Course, Aggregate (which could be CGPA or percentage), and Contact information such as email or phone number. Additional optional attributes could include address, year of study, and technical or soft skills, but for simplicity, only core attributes are included here.

Company:

The **Company** entity represents organizations participating in the campus recruitment process. Each company is uniquely identified by a **CompanyID** (primary key). Other essential attributes include the **Company Name**, the **Industry** it belongs to, and the **Requirements** that define eligibility criteria or specific skills and technologies sought in candidates. Optional fields could be added for more detail, such as the company's website, address, or the contact person's information.

Placement Drive:

The **PlacementDrive** entity represents a scheduled recruitment event conducted by a company. Each drive is uniquely identified by a **DriveID** (primary key). It includes details such as the **Date** of the drive, **Type** (for instance, 'On-Campus' or 'Off-Campus'), the **Venue** of the event, and a brief
Description. It also includes a **CompanyID**, which serves as a foreign key referencing the **Company** entity to link the drive to the specific recruiting organization.

Selection:

The **Selection** entity records the outcome of a student's participation in a placement drive. It acts as an associative entity that links **Student**, **Company**, and **PlacementDrive** entities together. The primary key is **SelectionID**. Foreign keys include **StudentID** (referencing the **Student** entity), **CompanyID** (referencing the **Company** entity), and **DriveID** (referencing the **PlacementDrive** entity). The **Status** attribute indicates the result of the placement attempt (e.g., 'Selected', 'Not Selected', 'Offered'). Optionally, attributes like **Salary** (if offered) and **OfferDate** can also be included for more comprehensive tracking.

6.4. Activity Diagram

Activity diagrams are behavioural diagrams used to model workflows or business processes. They depict the sequence of activities and the flow of control from one activity to another. We will use activity diagrams to illustrate two key workflows: adding a new student and a simplified process for conducting a placement drive.

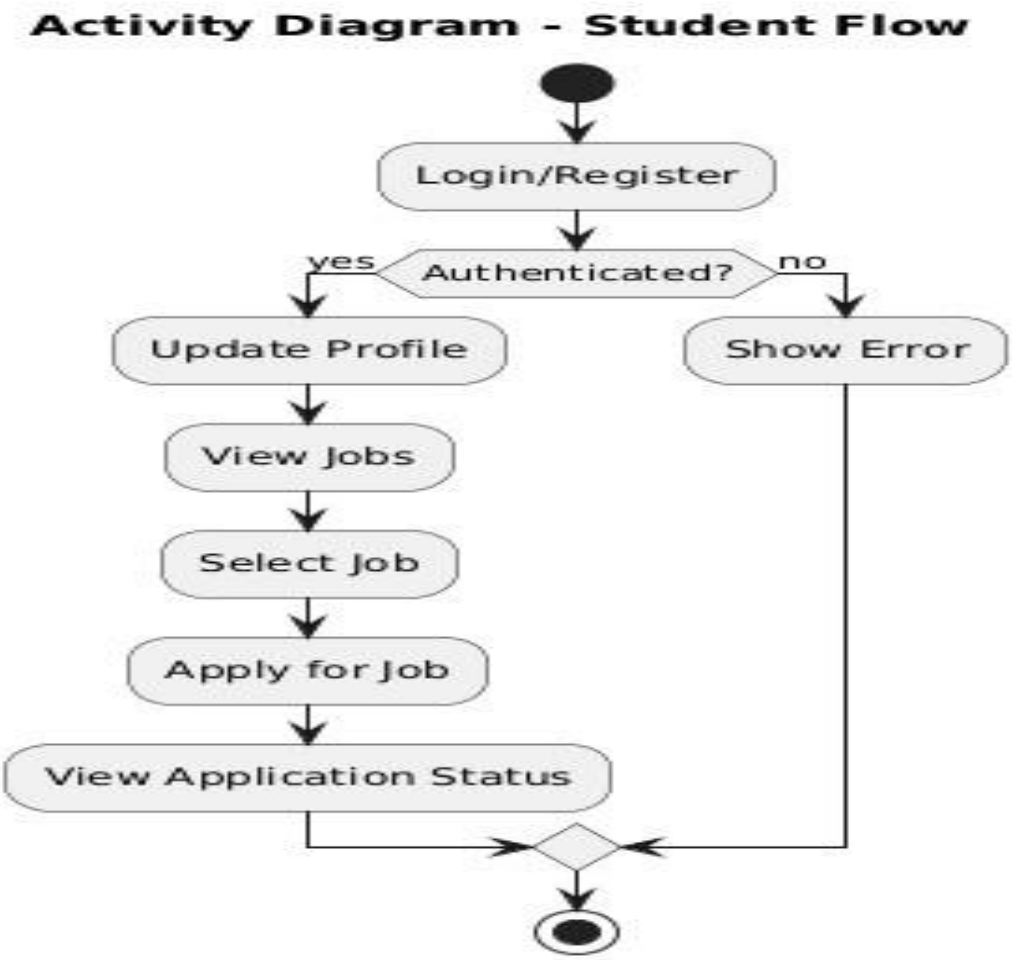

Figure 6.4: Activity Diagram

Visual Representation: Activity diagrams use rounded rectangles to represent activities (actions or steps), arrows to show transitions between activities, diamonds to represent decision points (where the flow can branch based on a condition), and swimlanes to partition activities by the entity or object responsible for performing them (e.g., Placement Officer, System). They start with a solid circle (initial node) and end with a solid circle enclosed in a larger circle (final node).

Activity diagrams are useful for understanding the flow of control and the steps involved in executing specific processes or workflows within the system and how the user and system collaborate.

6.5. Sequence Diagram

This diagram shows the steps involved when a Placement Officer adds a new student record. **Participants:** Placement Officer (Actor), Student Registration UI (HTML Form), Student Logic (PHP Script/Class), DatabaseConnection (PHP Class), Database (MySQL).

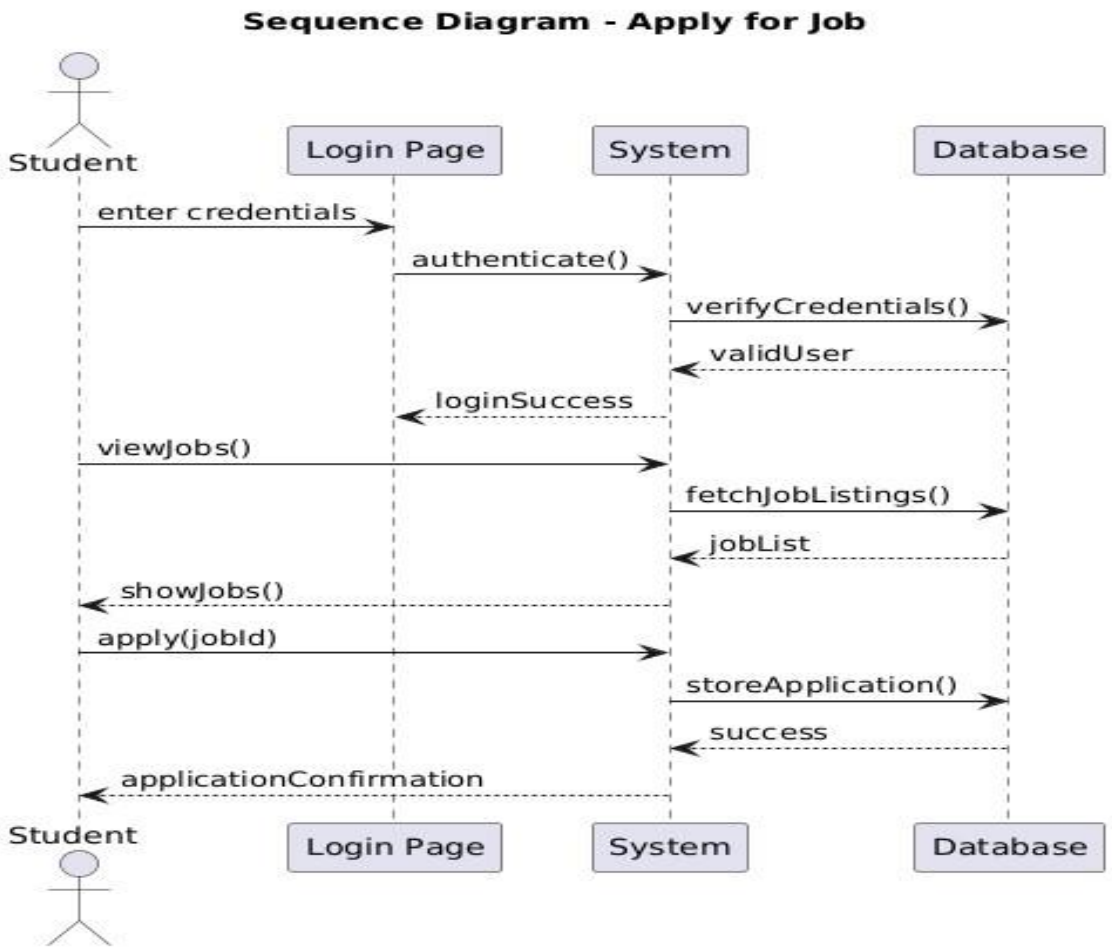

Figure 6.5 : Sequence Diagram

Sequence diagrams are valuable for understanding the order of operations and interactions between different software components and users for specific system tasks.

6.6 Class Diagram

A Class Diagram is a static structural diagram that describes the structure of a system by showing the system's classes, their attributes, operations (or methods), and the relationships among objects. While the project is implemented using procedural PHP, conceptualizing the system using classes helps in organizing the codebase and understanding the logical components and their interactions from an object-oriented perspective.

Visual Representation: The diagram shows classes as rectangles divided into three compartments:

the class name, its attributes, and its operations (methods). Lines connect classes to indicate relationships like association, aggregation, composition, or inheritance.

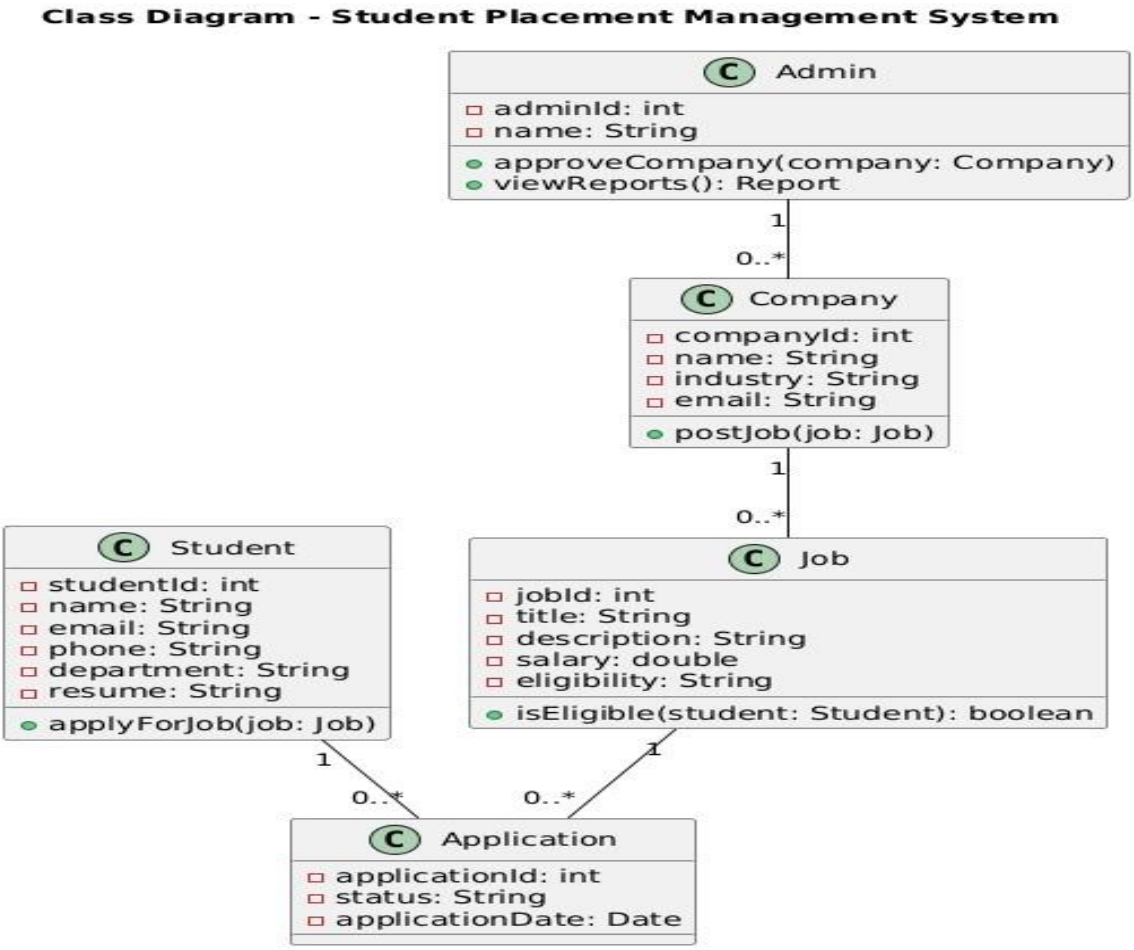

Figure 6.6 : Class Diagram

The class diagram helps in structuring the PHP code into logical units (potentially as separate PHP files or a more organized class-based structure if an MVC-like pattern is adopted, even simply).

6.7 Modules:

Student Management:

Functionality:

Add, update, and delete student records (Roll No, Name, Department, Course, Aggregate, Skills.

Upload resumes and academic documents.

Track student placement status (Placed/Unplaced).

Features:

Search & filter students by department, CGPA, skills, etc.

Export student data in Excel/PDF format.

Placement Drive Management :

Functionality:

Schedule on-campus/off-campus drives.

Record student attendance for each drive.

Update selection status (Selected/Rejected).

Features:

Automated notifications for upcoming drives.

Integration with calendar (Google Calendar).

Reports & Analytics :

Functionality:

Generate Reports on:

Placed vs Unplaced students Company wise Hiring Trends

Features:

Exports Reports in Pdf/Excel.

Year-on-Year Comaprision

Admin and Use Access

Functionality:

Role-based login (Admin, Placement Officer, Student).

Admin can manage users and permissions.

Features:

Secure authentication (Password protection)
Audit logs for tracking changes.

6.8 Software Profile:

The Placement Management System is a web-based application designed to streamline the placement process for educational institutions, connecting students with potential employers.

Frontend:

- **HTML5**: Used for structuring web pages and content
- **CSS**: For styling and layout.
- **JavaScript**: For client-side interactivity.

Backend:

- **PHP**: Server-side scripting language for business logic and data processing

Development Environment:

- **XAMPP Server**: Local development stack including:
- Apache HTTP Server (web server)
- MySQL (database management system)
- PHP (scripting language)
- Perl (optional, not likely used in this project)

Database:

- **MySQL** (included in XAMPP) for storing:
- Student records
- Company information
- Placement details
- User accounts

Supported Platforms:

- **Windows**
- **XAMPP** (as mentioned in your setup)
- **WAMP** (alternative to XAMPP)Windows 10/11 with proper web server configuration
- **Ubuntu/Linux**
- **Lamp Stack** (Linux, Apache, MySQL, PHP)
- **Ubuntu** 18.04 LTS/20.04 LTS/22.04 LTS Other Debian-based distributions

6.9 System Requirements

System requirements specify the minimum hardware and software needed to run the proposed Placement Details Management System. These requirements apply to both the server environment where the application is hosted and the client machines used by the placement department staff.

6.9.1 Software Requirements

- **Server:**

Operating System:

A stable server operating system such as Ubuntu Server, CentOS, Debian, or Windows Server.

Web Server:

Apache HTTP Server (version 2.4 or later) or Nginx.

PHP Interpreter:

PHP (version 7.4 or later recommended, compatible with the specific PHP functions and libraries used). PHP must be configured to work with the chosen web server.

Database Server:

MySQL Community Server (version 5.7 or later) or MariaDB. The database server must be configured and accessible by the PHP scripts.

Required PHP Extensions:

MySQLi or PDO extension for database connectivity, along with other standard extensions needed for web development (e.g., session support, file handling).

• **Client Machines:**

Operating System:

Any modern desktop operating system such as Windows, macOS, or Linux.

Web Browser:

A modern web browser compatible with HTML5 and standard web protocols, such as Google Chrome, Mozilla Firefox, Microsoft Edge, or Apple Safari (recent versions recommended).These system requirements are relatively standard for a web application utilizing the LAMP (Linux, Apache, MySQL, PHP) or WAMP (Windows, Apache, MySQL, PHP) stack, confirming the technical and economic feasibility discussed earlier. The selected technologies ensure the system can operate efficiently and reliably within a typical institutional IT environment.

6.9.2 Hardware Requirements

• **Server:**

Processor:

A multi-core processor (e.g., Intel Core i5 or equivalent, or a server-grade CPU like Intel Xeon or

AMD EPYC for production use) with sufficient speed to handle web requests and database queries.

RAM:

Minimum 4GB RAM, with 8GB or more recommended, especially for handling concurrent users and larger datasets.

Storage:

Sufficient hard disk space to store the operating system, web server software, PHP interpreter, MySQL database server, and the database itself. An initial estimate might be 10GB to 20GB, but this should scale with the number of records stored. Fast storage (e.g., SSD) can improve database performance. Network Interface: A standard Ethernet network interface card (NIC) for connecting to the local network and potentially the internet.

• **Client Machines:**

Processor:

Standard modern desktop or laptop processor.

RAM:

Minimum 2GB RAM, 4GB or more recommended.

Storage:

Minimal local storage required, only for the operating system and web browser. Network Interface:

Standard network connectivity (wired or wireless) to access the server.

Input/Output:

Standard monitor, keyboard, and mouse.

These system requirements are relatively standard for a web application utilizing the LAMP (Linux, Apache, MySQL, PHP) or WAMP (Windows, Apache, MySQL, PHP) stack, confirming the technical and economic feasibility discussed earlier. The selected technologies ensure the system can operate efficiently and reliably within a typical institutional IT environment.

6.10 Requirement Analysis :

6.10.1 Non functional Requirements

- **Security:**

  The system must provide secure access through user authentication (login)

  User passwords should be stored securely (e.g., hashed). Data transmission between the browser and server should be secured (e.g., using HTTPS, though this might be dependent on deployment Infrastructure)

  The system should include measures to prevent common web vulnerabilities like SQL injection and cross-site scripting (XSS) through secure coding practices (e.g., using prepared statements for database queries in PHP).

- **Performance:**

  The system should exhibit acceptable response times for common operations such as logging in, adding/updating records, searching, and generating reports, even as the amount of data grows.

  Database queries should be optimized for efficient data retrieval.

- **Usability:**

  The web interface should be intuitive and easy for placement department staff to learn and use with minimal training.

  Navigation should be clear and consistent across all pages. Error messages should be clear and helpful.

  Data entry forms should be well-structured and include appropriate input validation and feedback.

Scalability:

While initially designed for a specific institution, the system architecture (using PHP and MySQL) should be capable of handling an increasing number of student and company records, placement drives, and potentially more users, without significant performance degradation.

The database design should accommodate future growth in data volume

- **Reliability:**

The system should be available and operational during designated working hours with minimal downtime.

Data should be reliably stored and retrieved without corruption or loss. Error handling should be robust.

6.10.2 Functional Requirements

- **Administrator Authentication:**

The system must require administrators/staff to log in with valid credentials (username/password) to access the system functionalities. Different roles (if applicable in a more complex version) might have varying levels of access.

- **Student Registration and Management:**

The system must allow administrators to add new student records.

Student records must include fields such as Roll Number, Name, Department, Course, Academic Aggregate (e.g., CGPA or percentage), Contact Information (Email, Phone), and other relevant details.

- **Updating Student Selection Status:**

The system must allow administrators to update the selection status of students for a particular company/drive.

Status options should include "Selected," "Not Selected," "Offered," "Rejected," etc.

7. Experimental studies

The Experimental Studies phase focuses on the testing and evaluation of the developed system to ensure it meets its functional and non-functional requirements. This section explains how the system was deployed, the data used for testing, and the results of various use-case executions. The Student Placement Management System was implemented using HTML for front-end form creation and data display, and SQL for back-end data management. The system was hosted on a local server environment using XAMPP, which includes Apache and MySQL.

Sample Code:

Database Setup:

```
CREATE TABLE `students` (
 `id` int(11) NOT NULL,
 `name` varchar(256) DEFAULT NULL,
 `email` varchar(256) DEFAULT NULL,
 `phone` varchar(256) DEFAULT NULL,
 `bio` varchar(256) DEFAULT NULL,
 `cv` varchar(256) DEFAULT NULL,
 `user_auth` int(11) DEFAULT NULL,
 `apply` varchar(250) DEFAULT NULL
) ENGINE=InnoDB DEFAULT CHARSET=latin1;
Dumping data for table `students`
INSERT INTO `students` (`id`, `name`, `email`, `phone`, `bio`, `cv`, `user_auth`, `apply`) VALUES
(7, 'chandu', 'chandu@gmail.com', '111', 'sss', 'Screenshot (1).png', NULL, NULL),

```

Project Overview:

The Student Placement Details Management System is a basic web application designed to manage and store information about students and their placement outcomes. It uses a 3-tier architecture where HTML is used for the frontend user interface, PHP serves as the backend processing logic, and MySQL is the database system responsible for storing and retrieving data. The system allows administrators to input student details, their placement company, package offered, and selection status, and view the stored records in a tabular format.

Database Design:

The system consists of two main tables: students and placements. The students table holds personal and academic data such as name, department, course, aggregate percentage, and contact details. The placements table stores placement-related data such as company name, salary package, and selection status. It includes a foreign key (student_id) to maintain a relational link with the student who received the placement. This relational model ensures data normalization and integrity, making it easy to track each student's placement information.

Backend Logic (PHP):

The backend of the application is developed using PHP, which handles form submissions and interacts with the database. When a user submits the form, PHP retrieves the data using the $_POST method. It first inserts the student's information into the students table. After successfully inserting the student, PHP retrieves the newly generated student_id and uses it to insert corresponding placement data into the placements table. This two-step insertion ensures that each placement record is properly linked to a specific student. The backend also includes logic to display a confirmation message and fetch all existing records for viewing.

Frontend Interface (HTML):

The user interface is built using HTML and presents a simple, easy-to-use form for entering student and placement details. The form includes fields for name, department, course, aggregate, and contact, along with placement-specific fields such as company name, package offered, and status. The form uses the POST method to submit data to the server, where it is processed by PHP. This minimal and intuitive interface allows users to input data without any prior technical knowledge.

Data Display and Reporting:

After the form submission, the system retrieves all records from the database using a SQL JOIN query and displays them in an HTML table. This report-style view shows each student's name, department, course, aggregate, along with the company name, package offered, and selection status. The display provides a quick overview of placement statistics and helps administrators or placement officers monitor progress and trends.

Execution Flow:

- The user opens the web page (e.g., placement.php).
- They fill out the student and placement information in the HTML form.
- On submission, the PHP backend captures the data and inserts it into the MySQL database.
- The page then reloads and shows a success message along with a table of all registered students and their placement results.

8.Conclusion and future scope

The Student Placement Details Management System is a foundational web-based application designed to streamline and digitize the process of managing student placement information. Built using HTML for the frontend, PHP for backend logic, and MySQL for data storage, the system ensures that placement records are efficiently recorded, updated, and retrieved. This project successfully addresses several real-world administrative challenges faced by educational institutions during campus placement seasons. By digitizing student and placement data, the system eliminates the need for manual record-keeping, reduces errors, and improves accessibility. The relational database model ensures data integrity through the use of primary and foreign keys, linking each student to their respective placement outcomes.

The application allows users to add new student records, associate them with specific placement drives, and store outcomes such as company name, package offered, and selection status. It also enables quick review of all stored data through an integrated reporting table. The use of PHP to handle form submissions and database interaction provides dynamic data processing, making the system responsive to user actions.From an educational and development perspective, this project demonstrates a clear understanding of full-stack web development principles, including:

- Designing normalized relational databases,
- Implementing server-side scripting for backend processing,
- Creating simple and usable frontend interfaces,
- Enabling data persistence using SQL queries.

While the system is basic in functionality, it lays the groundwork for future enhancements such as:

- User authentication (admin/student login),
- Placement drive scheduling,
- File uploads (like resumes or offer letters),
- Role-based access controls,
- Data filtering and export features (PDF/Excel),

- Integration with email or SMS notifications.

In conclusion, the Student Placement Details Management System meets its intended goal of simplifying placement data management and provides a scalable framework for building more comprehensive and professional placement portals.

It is a practical, functional, and educational project that demonstrates core web development skills and can be readily expanded to suit larger institutional needs.

Future Scope and Enhancement Opportunities for the Student Placement Management System:

The project has the potential to evolve far beyond its current capabilities, transforming into a comprehensive career development ecosystem that leverages cutting-edge technologies to benefit students, recruiters, and academic institutions. By integrating advanced analytics, artificial intelligence, and seamless automation, the system can revolutionize how placements are managed, making the process more efficient, personalized, and data-driven.

Advanced Analytics and Intelligent Decision-Making

One of the most significant future enhancements lies in the integration of predictive analytics and intelligent reporting. By harnessing machine learning algorithms, the system can analyze historical placement data, academic performance, and industry trends to forecast placement probabilities for students. This predictive capability would enable career counselors to provide targeted guidance, helping students focus on skill development areas that align with market demands. Interactive dashboards with dynamic visualizations—such as heatmaps of high-demand skills, trend graphs of recruitment patterns, and comparative salary analyses—would empower stakeholders to make informed decisions. Additionally, automated report generation would allow for customized PDF or Excel exports tailored to the needs of students, recruiters, and administrators, eliminating manual data compilation.

Mobile-First Accessibility and Real-Time Engagement

In an increasingly mobile-driven world, the system must extend its reach beyond desktop interfaces. Developing dedicated iOS and Android applications would ensure that students and recruiters can access job postings, schedule interviews, and receive real-time notifications on the go. A Progressive Web App (PWA) version could offer a lightweight, browser-based alternative with offline functionality, ensuring accessibility even in low-connectivity environments. Furthermore, integrating chatbots on platforms like WhatsApp

or Telegram could automate routine queries, sending instant alerts for interview schedules, application deadlines, and new job postings, thereby enhancing engagement without requiring constant manual intervention.

AI-Driven Personalization and Automation

Artificial intelligence can play a transformative role in streamlining the placement process. An AIpowered resume-matching engine, utilizing Natural Language Processing (NLP), could automatically align student profiles with job descriptions, significantly reducing the time recruiters spend on shortlisting candidates. A 24/7 virtual assistant chatbot could handle frequently asked questions, providing instant responses regarding application procedures, company requirements, and interview preparation tips. Moreover, an AI-driven mock interview platform could simulate real hiring scenarios, analyzing students' verbal responses, body language, and technical knowledge to provide constructive feedback, thereby boosting their confidence and employability.

Seamless Third-Party Integrations for a Unified Ecosystem

To create a truly interconnected recruitment environment, the system should integrate with external

HR and learning platforms. Direct API connections with job portals like LinkedIn, Naukri, and Indeed would enable automatic posting of vacancies and streamlined applicant tracking. Synchronization with Learning Management Systems (LMS) such as Moodle or Blackboard would allow the system to recommend career paths based on academic performance. Additionally, partnerships with video interview platforms like HireVue or SparkHire could facilitate remote hiring processes, making it easier for global companies to recruit from the institution.

Personalized Career Development and Mentorship

Beyond job placements, the system could evolve into a lifelong career companion for students. By conducting skill gap analyses, it could identify areas where students need improvement and recommend relevant courses from platforms like Coursera or Udemy. Personalized career path suggestions, based on academic background and industry trends, would help students make informed decisions about their professional journeys. A built-in

mentorship network could connect current students with alumni and industry professionals, fostering guidance, networking opportunities, and long-term career growth.

Enhanced Employer Engagement and Recruitment Tools

For recruiters, the system could offer advanced tools to simplify hiring. Automated candidate shortlisting using AI would filter applications based on predefined criteria, saving time and effort. Virtual career fairs hosted within the platform could feature interactive company booths, live chat support, and interview scheduling tools, replicating the in-person recruitment experience online. Employer branding pages would allow companies to showcase their work culture, employee benefits, and success stories, making it easier to attract top talent.

Administrative Efficiency and Compliance Automation

To reduce administrative burdens, workflow automation could be introduced for tasks like generating and digitally signing offer letters, sending bulk email/SMS notifications for job openings, and maintaining audit logs for compliance tracking. Blockchain technology could further enhance security by enabling tamper-proof credential verification and smart contracts for automated offer processing.

Global Expansion and Inclusivity

As institutions attract a more diverse student body, multi-language support and resources for international placements—such as visa guidance and salary benchmarking across regions—would become essential. Ensuring accessibility for differently-abled users through WCAG-compliant designs, voice navigation, and screen reader compatibility would make the platform inclusive for all.

Conclusion: Building a Smart Career Ecosystem

By embracing these advancements, the Student Placement Management System can transition from a basic tracking tool into a dynamic, AI-powered career ecosystem. It would not only enhance placement rates but also provide lifelong career support, bridging the gap between education and employment in an increasingly competitive world. This evolution would position academic institutions as forward-thinking leaders in career readiness, benefiting students, recruiters, and society at large.
